

ABSTRACT

The present invention relates to a refrigerated air supply system (21) for a freezer and/or refrigerator cabinet having at least one cabinet compartment (17) at least partly defined by inner walls (16), an insulation layer at least partly enclosing said cabinet compartment.

- 5 Said cabinet compartment (17) has an compartment opening facing substantially upwards, which compartment opening connects said cabinet compartment (17) with the space surrounding said cabinet, said cabinet also comprising, a door which in one position covers said compartment opening and substantially encloses said cabinet compartment (17). The cabinet further comprises a machine compartment (23) for storing
- 10 at least a compressor, at least one of said inner walls (16) having a substantially horizontal shelf plane (52) where at least one off the planes (52) is being positioned vertically above said machine compartment (23). The refrigerated air supply system (21) of the present invention is positioned inside at least one of said cabinet compartments, the system comprising at least one evaporator (26), at least one return ducting part and
- 15 at least one fan (28). Said refrigerated air supply system (21) further comprises at least one air supply outlet which provides an airflow (47) into at least one of said cabinet compartments (17) and at least one air supply inlet which brings an airflow (50) out from at least one of said cabinet compartments (17).
